

Motorola Sales Dashboard – Project Report

Project Type: Sales Analytics / Business Intelligence Dashboard

Tool: Power BI

1. Project Overview

An interactive sales dashboard was created to analyze Motorola mobile sales across brands, mobile models, cities, days, customer ratings, and payment methods.

2. Objectives

The main objectives were to track sales KPIs, compare brands and mobile models, analyze city-wise performance, study daily trends, understand customer ratings, and examine payment-method usage.

3. KPIs Created

The dashboard displays Total Sales (68M), Total Quantity (2K), Transactions (325), and Average (42K) as headline metrics. These values represent the screenshot state and can change with filters.

4. Interactive Filters

Slicers were added for Mobile Model, Payment Method, Brand, Day Name, and Month so users can interactively filter the complete dashboard.

5. Visualizations

The report includes a city sales map, total quantity by day line chart, customer ratings bar chart, transactions by payment method donut chart, brand summary table, mobile-model sales bar chart, and sales by day-name area/line chart.

6. Skills Demonstrated

Data visualization, dashboard design, KPI reporting, interactive filtering, geographic analysis, trend analysis, category comparison, and business reporting.

7. Tools

Power BI, Power Query, DAX, and Power BI visual/report design.

8. Business Questions Supported

The dashboard can be used to explore which brands and models generate more sales, where sales are distributed geographically, which payment methods are common, how sales vary by day, and how customer ratings are distributed.

9. Conclusion

The project demonstrates how transactional sales data can be transformed into an interactive business intelligence dashboard that supports quick analysis and deeper drill-down through filters.
